KONFORT 750R

- Full Automatic Functions
- SD Card for Service & Vehicle Database
- Color TFT Display - Multi Language
- 4 CFM Double Stage Vacuum Pump
- Charging Accuracy - High Efficiency
- Simplified Maintenance

FORMING GAS LEAK DETECTION

Confirm Micro Leaks In R134a / R1234yf / R744 (CO2) Refrigerant Systems

Charge any system type with the Forming Gas at the desired pressure.
Use the portable H2 Detect, to easily detect any hydrogen leak in the system.

FORMING GAS CART TTF 700

Equipped with all the necessary tools to operate on A/C systems

FORMING GAS CASE

Included with the Forming Gas cart TTF 700 as part of instrumentation

H2 DETECT SNIFFER

Detects any hydrogen in the air with precision, allowing you to detect the leak location.

Meets Daimler AG's requirements for gas detectors because Forming Gas is a non-polluting and readily available gas mixture that consists of 95% nitrogen and 5% hydrogen.

Hydrogen (H2) molecular size is much smaller than other refrigerant gas, so micro leaks can easily be detected. Hydrogen is present in the air in small quantities to be easily detected by a sniffer.

Most AC service can be resolved with a refrigerant recharge. But to safely diagnose the AC systems without overlooking the problem, efficient leak detection is a responsible decision.

- Pure nitrogen may signal multiple leaks, but does not detect precise location.
- UV tracer doesn't provide immediate detection and requires later system flush.
